```

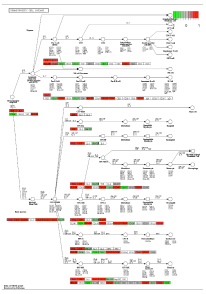
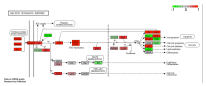
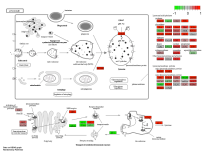
Make my input vector

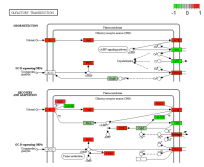
The top two here (hsa04110, and hsa03030) appear to be the main sets picked out. I will now use 'pathview' to pull these pathways and color up my genes that intersect with these tow pathways

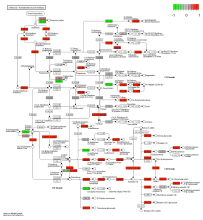
And insert into my report here:

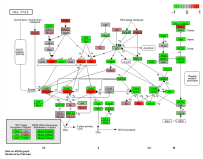












#Go: Gene Ontology

We can do the same style of analysis with Go instead of KEGG here.

```
data(go.sets.hs)
data(go.subs.hs)

# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)

lapply(gobpres, head)
```

```

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Now upload this here < https://reactome.org/PathwayBrowser/#TOOL=AT

The pathway with the most significant “Entities p-value” is the “Cell Cycle, Mitotic” pathway, which has a p-value of 5.28E-4 And Cell Cycle 6.22E-4.
