class 8: Breast Cancer Mini Project

Kai Zhao (PID: A17599942)

Outline

Today we will apply the machine learning methods we introduced in the last class on breast. cancer biopsy data from fine needle aspirations (FNA)

##Data input The data is suppled on CSV format:

```
wisc.df <- read.csv("WisconsinCancer.csv", row.names = 1)
head(wisc.df)</pre>
```

	diagnosis radius	s_mean	texture_mean	perimeter_mean	area_mean	ı

Now I will store the diagnosis for later and exclude it from the data set I will actually do things with that I will call wisc.data

```
diagnosis <- as.factor(wisc.df$diagnosis)
wisc.data <- wisc.df[,-1]</pre>
```

Q1 How many people are in this data set?

```
nrow(wisc.df)
[1] 569
    Q2. How many of the observations have a malignant diagnosis?
  table(wisc.df$diagnosis)
 В
      Μ
357 212
  sum(wisc.df$diagnosis=="M")
[1] 212
    Q3. How many variables/features in the data are suffixed with _mean?
  x <- colnames(wisc.df)</pre>
  length(grep("_mean",x))
[1] 10

  pc1_variance
[1] 0.44272
     Q5. How many principal components (PCs) are required to describe at least 70%
     of the original variance in the data?
   cum_var <- cumsum(summary(wisc.pr)$importance[2,])</pre>
  num_pcs_70 \leftarrow which(cum_var >= 0.70)[1]
  num_pcs_70
PC3
  3
     Q6. How many principal components (PCs) are required to describe at least 90%
     of the original variance in the data?
  num_pcs_90 \leftarrow which(cum_var >= 0.90)[1]
  num_pcs_90
PC7
  7
```

Principal Component Analysis

We need to scale our input data before PCA as some of the columns are measured in terms of very different units with different means and different variances. The upshot here is we set scale=TRUE argument to prcomp()

```
wisc.pr <- prcomp( wisc.data, scale= TRUE )
summary (wisc.pr)</pre>
```

```

Generate one of our main result figures - the PC plot (a.k.a. "source plot", "orientation plot", "PC1 vs PC2 plot", "PC plot", "Projection plot", etc.) It is known by different names in different fields.

Q7. What stands out to you about this plot? Is it easy or difficult to understand? Why?

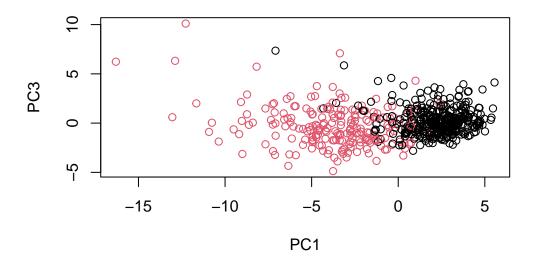

biplot(wisc.pr)

 $\verb|plot(wisc.pr$x[,1],wisc.pr$x[,2], col = diagnosis|)|$

Q8. Generate a similar plot for principal components 1 and 3. What do you notice about these plots?

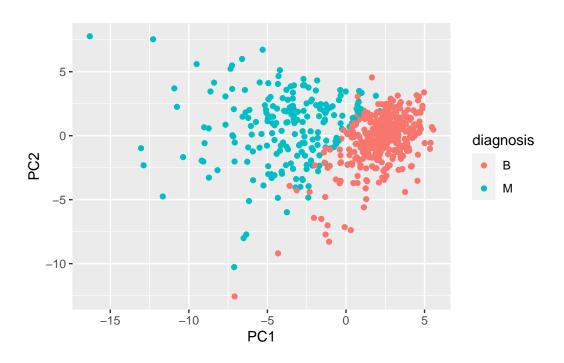

Add a ggplot version

```
df <- as.data.frame(wisc.pr$x)
df$diagnosis <- diagnosis

# Load the ggplot2 package
library(ggplot2)

# Make a scatter plot colored by diagnosis
ggplot(df) +
   aes(PC1, PC2, col=diagnosis) +
   geom_point()</pre>
```

Calculate variance of each principal component

```
pr.var <- (wisc.pr$sdev^2)
head(pr.var)

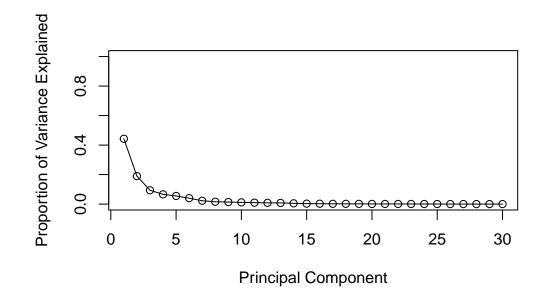

[1] 13.281608 5.691355 2.817949 1.980640 1.648731 1.207357</pre>
```

Variance explained by each principal component: pve

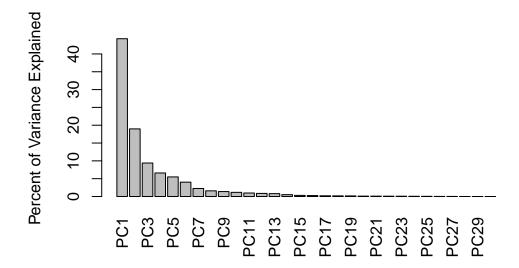

```
pve <- pr.var / sum(pr.var)</pre>
```

Plot variance explained for each principal component

```
plot(pve, xlab = "Principal Component",
    ylab = "Proportion of Variance Explained",
    ylim = c(0, 1), type = "o")
```

Alternative scree plot of the same data, note data driven y-axis

Q9. For the first principal component, what is the component of the loading vector (i.e. wisc.pr\$rotation[,1]) for the feature concave.points_mean?

```
wisc.pr$rotation["concave.points_mean", 1]
```

[1] -0.2608538

Q10. What is the minimum number of principal components required to explain 80% of the variance of the data?

```
cumulative_pve <- cumsum(pve)
which(cumulative_pve >= 0.8)[1]
```

[1] 5

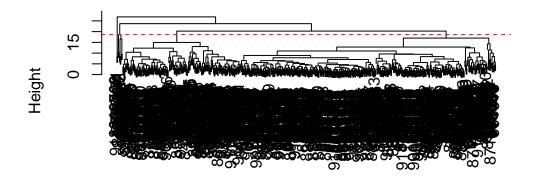

Hierarchical clustering

Can we just use clustering on the original data and get some insight into M vs B? It is difficult, this "tree" looks like a hot mess... Q11. Using the plot() and abline() functions, what is the height at which the clustering model has 4 clusters?

```
#distance matrix needed for hclust

data.dist <- dist(scale(wisc.data))
wisc.hclust <- hclust(data.dist)
plot(wisc.hclust)
abline(h = wisc.hclust$height[length(wisc.hclust$height) - 4 + 1], col="red", lty=2)</pre>
```

Cluster Dendrogram

data.dist hclust (*, "complete")

```
wisc.hclust.clusters <- cutree(wisc.hclust, k=4)
table(wisc.hclust.clusters, diagnosis)</pre>
```

Q12. Can you find a better cluster vs diagnoses match by cutting into a different number of clusters between 2 and 10?

```
comparison_list <- list()</pre>
  for(k in 2:10) {
    clusters <- cutree(wisc.hclust, k)</pre>
    comp_table <- table(clusters, diagnosis)</pre>
    comparison_list[[paste0("k=", k)]] <- comp_table</pre>
  }

clusters B M
1 0 115
2 6 48
3 337 48
4 14 1
```

5. combining methods

This approach will take not orignal data but our PCA results and work with the.

```
d <- dist(wisc.pr$x[,1:3])
wisc.pr.hclust <- hclust(d, method = "ward.D2")
plot(wisc.pr.hclust)</pre>
```

Cluster Dendrogram

d hclust (*, "ward.D2")

Generate 2 cluster groups from this helust object.

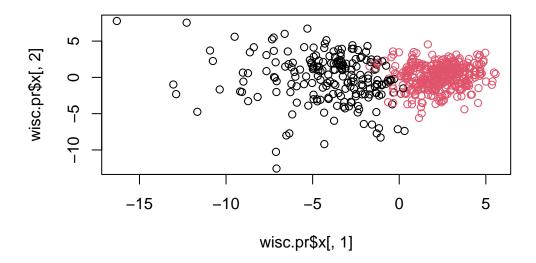

```
grps <- cutree(wisc.pr.hclust, k= 2)
grps</pre>
```
